

title

- The Recreational User PCL of 220 ng/Kg is more conservative than the Industrial Interim PRG of 665 ng/Kg
- The TSWQS for fish tissue of 0.4 ng/Kg is probably not obtainable as long as there are so many legacy sources of contamination throughout the watershed and is more conservative than health values used in developing fish advisories
- The TEQ approach for this site is appropriate as the site is dominated by TCDF
- Adherence to Fish advisories remains the most protective measure for fish/shellfish consumption
